

Furore

- **Everbearer**
- **Beautiful conical fruits**
- **Tolerant to diseases**
- **Fast growth, therefore high yield**

Furore

A productive everbearer

Furore is a productive everbearer known for its bright glossy fruit. The fruits have an attractive, conical structure and an interesting fruit size, although the fruit skin is relatively sensitive. During warm periods, however, fruit set remains good, which improves harvest reliability.

Cultivation

The plant itself has strong characteristics; Furore is tolerant to common pests such as mildew and thrips, and also has good resistance to root diseases. A special feature of Furore is the rapid growth of new rhizomes, which allows the plant to quickly come into production from new flowers.

Harvesting and sales

In terms of production, Furore is very suitable for both supermarket sales and direct marketing. Due to its rapid growth, this variety is early in production and produces high yields even with light plants.

Recommendations

There are some recommendations to get the best out of Furore. The trace dose for Furore is largely the same as for other varieties, but it is important to be careful with too much manganese and boron in the nutrient solution. Because Furore absorbs calcium very easily, magnesium deficiency can occur more quickly than with other

varieties. Furthermore, compared to other pass-through varieties, Furore tends to be more generative and not too easily vegetative. To ensure that the crop continues to make enough new leaf positions and lateral noses, the use of ammonium can be useful.

All in all, Furore is a versatile and productive bearer with attractive fruits and strong plant traits. With the right care and nutritional approach, this variety can reach its maximum potential.
